

A Unified Payments Core Built for Scale

One platform. All rails. Real-time ready.

Finzly BankOS

Account Galaxy

Payment Galaxy

Digital Galaxy

Trade Galaxy

Token Galaxy

Payments today run across disconnected systems- ACH in one platform, wires in another, instant payments elsewhere, and separate infrastructure for cross-border. Each new rail adds integration effort, compliance overhead, and operational complexity.

Payment Galaxy provides a unified platform to process, control, and manage payments across fiat and tokenized rails

ACH

Domestic wires

Cross-border wires

Real-time Payments
(RTP, FedNow)

Cards

Tokenized rails

Designed for composability and incremental adoption, it enables institutions to modernize payments infrastructure using a surround-and-shrink approach - integrating with existing systems while progressively consolidating functionality into a unified processing layer. It replaces fragmented, rail-specific infrastructure with a modern, API-driven foundation designed for scale, speed, and control.

Features

Unified API for All Payment Rails

One integration layer across traditional and emerging payment networks.

- ACH, Fedwire, RTP, FedNow, SWIFT, cards
- Stablecoins and tokenized deposits
- Single API abstraction across all rails
- Simplified onboarding of new payment networks

Multi-rail Orchestration

Centralized control across all payment systems.

- Unified orchestration across legacy and modern rails
- Consistent processing logic across payment types
- Simplified operations across fragmented infrastructures

Pre-processing Intelligence Layer

Standardized validation before execution.

- Real-time risk screening and compliance checks
- Data enrichment and message normalization
- Balance, policy, and format validation
- Event propagation across internal systems

Intelligent Payment Routing

Optimized execution for every transaction.

- Route based on speed, cost, and business rules
- Real-time rail performance awareness
- Built-in failover for continuity and resilience

Real-time Payment Visibility

End-to-end transparency across the payment lifecycle.

- Live tracking from initiation to settlement
- Unified dashboards across all rails
- Real-time status, volumes, and exceptions

Centralized Risk & Controls

Consistent governance across all payments.

- Fraud, compliance, and policy enforcement
- Transaction limits and approval workflows
- Role-based access with full audit trails

Exception Management Automation

Reduced operational workload and faster resolution.

- Automated handling of returns, repairs, and disputes
- Machine learning-based pattern detection
- Significant reduction in manual intervention

Core-agnostic, ISO 20022 Native

Independent, standardized foundation for modern payments.

- Operates alongside existing cores and payment hubs
- ISO 20022-native data model for interoperability
- High-throughput, cloud-native processing
- Full auditability and regulatory traceability

Flexible Adoption Models

Payment Galaxy supports multiple adoption paths, allowing institutions to modernize payments at their own pace while maintaining operational continuity.

Orchestration Model (Control Layer)	Modular Adoption Model (Surround-and-Shrink)	Unified Platform Model (Full Consolidation)
Payment Galaxy is deployed as a unified orchestration layer across existing payment systems. • Sits above legacy and modern processors • Routes and controls payment flows across all systems • Provides unified visibility and operational control • Enables new capabilities without replacing existing infrastructure	Payment Galaxy incrementally surrounds and absorbs legacy payment processing. • Surrounds existing ACH, wire, and payment hubs • Introduces new payment capabilities alongside legacy systems • Gradually shifts processing into Payment Galaxy • Reduces dependency on legacy infrastructure over time	Payment Galaxy becomes the single processing platform for all payment rails. • All payments processed through one unified engine • Standardized operations across traditional and tokenized rails • Consolidation of multiple payment systems into one platform • Legacy systems fully phased out over time
Result: Immediate control and standardization across fragmented payment environments.	Result: Controlled modernization with progressive retirement of legacy systems.	Result: A unified payments environment across all rails.

BankOS: The Innovation Core for Modern Banking

BankOS is Finzly's unified platform, seamlessly integrating all banking operations and serving as the innovation core for banks. Powered by a universe of "galaxies," each delivering a unique capability, BankOS connects them all to provide a completely integrated, cohesive experience across traditional and tokenized assets, giving bankers with streamlined operations and giving clients modern, connected financial services.
